

MICROSOFT SOLUTION BRIEFING • LIGHT & WONDER

Modernizing Work Management and Collaboration on the Microsoft Platform

How Azure DevOps and SharePoint compare to Jira and Confluence

Azure DevOps and SharePoint deliver Jira and Confluence capabilities on one governed Microsoft platform

1

About 10,000 Atlassian users today

Roughly 6,000 Jira and 4,000 Confluence users across global teams

2

Two tools add overhead

Separate licensing, integration, and governance sit outside the Microsoft estate

3

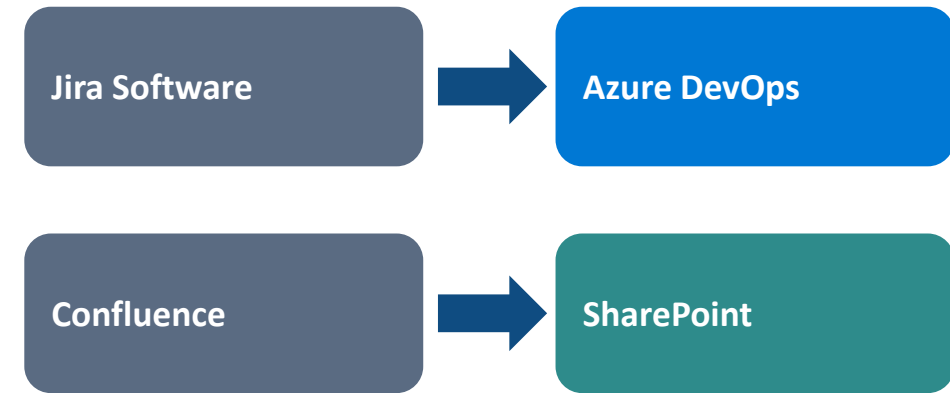

Native Microsoft equivalents

Azure DevOps replaces Jira for work; SharePoint replaces Confluence for docs

4

One platform, one identity

Both integrate with Teams, Entra ID, Microsoft 365, and Copilot

Capability-for-capability replacement

Recommended next step: schedule the working session with Ashish to validate fit and shape a phased migration.

LNW's Atlassian footprint spans two tools and about 10,000 users

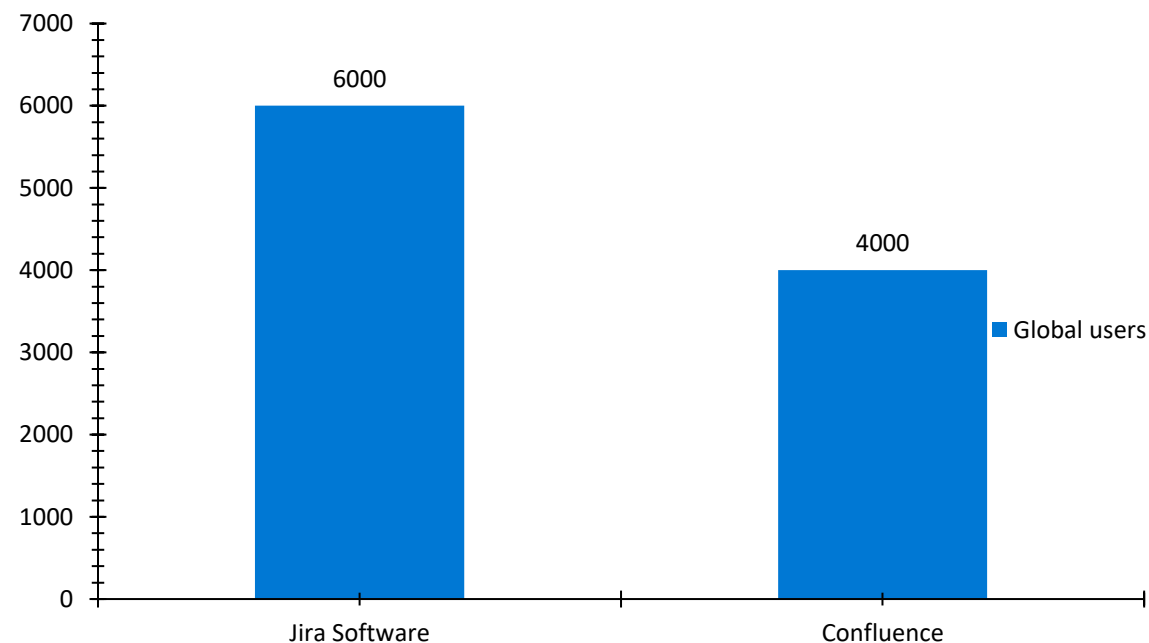

6,000

Jira Software users

4,000

Confluence users

LNW is evaluating Azure DevOps and SharePoint as consolidated, native alternatives.

Source: LNW figures shared July 2026

Each Atlassian capability maps to a native Microsoft equivalent

MICROSOFT PLATFORM

Azure DevOps — Boards, Repos, Pipelines

SharePoint — Pages, Sites, Loop, OneNote

Power Automate — flows and approvals

Microsoft Entra ID — identity and access

Unified by Microsoft Teams, Microsoft 365, and Microsoft Copilot

Azure DevOps matches Jira on agile planning and adds native code and CI/CD

Capability	Jira Software	Azure DevOps
Backlogs & boards	Scrum and Kanban boards	Azure Boards: backlogs, sprints, boards
Agile planning	Epics, stories, sprints	Work items, features, Delivery Plans
Custom workflows	Workflow schemes	Configurable states and rules
Queries & reporting	JQL and dashboards	WIQL, dashboards, Analytics views
Source control	Bitbucket or GitHub add-on	Native Azure Repos (Git)
CI/CD pipelines	Pipeline add-ons	Native Azure Pipelines
Test management	Xray or Zephyr apps	Azure Test Plans
Extensibility & SSO	Marketplace, Atlassian Access	Marketplace, REST APIs, Entra ID

SharePoint covers Confluence documentation and adds enterprise content governance

Capability	Confluence	SharePoint + Microsoft 365
Pages & spaces	Spaces, pages, blogs	Sites, pages, news posts
Rich editing	Editor and macros	Modern pages and web parts
Templates	Page templates	Site and page templates
Co-authoring	Real-time editing	Co-authoring across Office and Loop
Search	Confluence search	Microsoft Search across Microsoft 365
Permissions	Space permissions	SharePoint and Entra ID groups
Governance	Limited native controls	Purview: retention, DLP, eDiscovery
Integrations	Marketplace apps	Teams, Loop, Power Platform, Graph

We mapped LNW's prioritized Jira and Confluence requirements to native Microsoft capabilities

Our approach

- Reviewed every Must, Should, and Nice requirement across 13 categories
- Prioritized the Must-have capabilities and the marketplace apps in use
- Mapped each to a native Azure DevOps, SharePoint, or Microsoft 365 feature
- Confirmed identity, security, and data residency for global teams

5,000

Jira Software licensed users

3,000

Confluence licensed users

~1,000 each

European users, served by the EU Data Boundary

Source: LNW Jira and Confluence requirement workbooks, July 2026 (licensed users; global totals are approximately 6,000 Jira and 4,000 Confluence)

Azure DevOps covers LNW's Must-have Jira requirements natively

LNW Jira requirement (Must-have)	Azure DevOps capability
Advanced automation, REST endpoints, custom logic	REST APIs, Service Hooks, webhooks, and Azure Functions
Workflow validators, conditions, and post-functions	Custom rules, state transitions, and branch policies
Portfolio roadmaps, Gantt, and resource planning	Delivery Plans with epic and feature hierarchy
Dynamic dashboards, time-in-status, advanced JQL	Analytics views, dashboards, and WIQL queries
Advanced and hierarchical custom fields	Custom fields, inherited process, custom work item types
Clone epics and child issues, sync and copy fields	Work item templates, copy, and automated field rules
Issue and ticket security, aggregate epic data	Area-path and organization security, rollup columns

LNW's Jira add-ons and integrations have direct Microsoft equivalents

Jira tool or marketplace app	Microsoft equivalent
ScriptRunner (scripted automation)	Azure Pipelines, REST APIs, and Power Automate
BigPicture Enterprise (portfolio planning)	Azure Boards Delivery Plans
JQL advanced queries	WIQL and Analytics (OData) queries
Okta SSO and MFA	Microsoft Entra ID SSO, MFA, and Conditional Access
Active Directory sync	Microsoft Entra ID and Entra Connect provisioning
GitHub and Perforce commit and PR sync	Azure Repos and native GitHub integration
qTest test case sync	Azure Test Plans

LNW's enterprise portfolio, resource, and time tools map to Azure DevOps and Power BI

BigPicture Enterprise

USED TODAY FOR

Portfolio and program management, strategic roadmaps, Gantt planning, and cross-project dependencies

MICROSOFT EQUIVALENT

Azure Boards Delivery Plans with Project for the web

Tempo

USED TODAY FOR

Resource capacity planning, allocation, and utilization tracking across global teams

MICROSOFT EQUIVALENT

Project for the web with Power BI resource and utilization reports

Status (time tracking)

USED TODAY FOR

Time-in-status, cycle time, and process performance metrics

MICROSOFT EQUIVALENT

Azure DevOps Analytics with Power BI time-in-state reports

Addresses the BigPicture Enterprise, Tempo, and Status tools called out in LNW's executive summary

SharePoint and Microsoft 365 cover LNW's Must-have Confluence requirements

LNW Confluence requirement (Must-have)	SharePoint and Microsoft 365 capability
Rich text, tables, templates, and macros	Modern pages, web parts, and page templates
Diagramming and auto-numbered headings	Visio web part and Word heading styles
Spaces, page hierarchy, labels, tree navigation	Sites, pages, metadata, and hub navigation
Version history and audit trail for edits	Version history and Microsoft Purview audit
Full-text, metadata, and intelligent search	Microsoft Search with Copilot semantic answers
Inline comments, mentions, and page watches	Co-authoring comments, mentions, and alerts
Central admin, config management, usage analytics	SharePoint and Microsoft 365 admin centers

LNW's Confluence marketplace apps map to built-in Microsoft 365 features

Confluence marketplace app	Microsoft equivalent
Draw.io (diagramming)	Visio for the web and the Visio web part
Table Filter and Charts	Lists, the Excel web part, and Power BI
Viewtracker (usage analytics)	SharePoint page analytics and M365 usage reports
Navitabs (navigation tabs)	Hub sites, mega menu, and Quick Links web part
Mosaic (advanced layouts)	Section layouts and web parts on modern pages
Questions for Confluence (Q&A)	Viva Engage communities and Q&A
ScriptRunner (custom logic)	Power Automate, SharePoint Framework, and Graph

Entra ID and Purview meet LNW's security, compliance, and data residency requirements

Identity and SSO

Microsoft Entra ID replaces Okta with SSO, MFA, and Conditional Access

Directory sync

Entra Connect provisions users from on-premises Active Directory

Audit and eDiscovery

Microsoft Purview delivers audit logs, retention, and eDiscovery

Data protection

Encryption at rest and in transit, DLP, and sensitivity labels

Data residency

EU Data Boundary serves the ~1,000 European users on each platform

Compliance and environments

SOC 2 and ISO 27001, with Prod, UAT, Test, and Dev separation

Covers SSO, MFA, audit logging, encryption, data residency, compliance certifications, and environment separation

Microsoft Copilot delivers LNW's generative AI requirements across work and content

AI-assisted content creation

Copilot in Word, SharePoint, and Loop drafts and summarizes pages

AI-assisted work item creation

Copilot in Azure Boards, plus GitHub Copilot for code

Intelligent search

Enterprise indexing, RAG, and chatbots ground answers on your content

Contextual recommendations

Copilot surfaces related work, people, and content

Automation suggestions

Copilot Studio suggests and builds flows and agents

Reporting insights

Copilot in Power BI explains trends and answers data questions

All AI runs inside your Microsoft 365 identity and data governance boundary

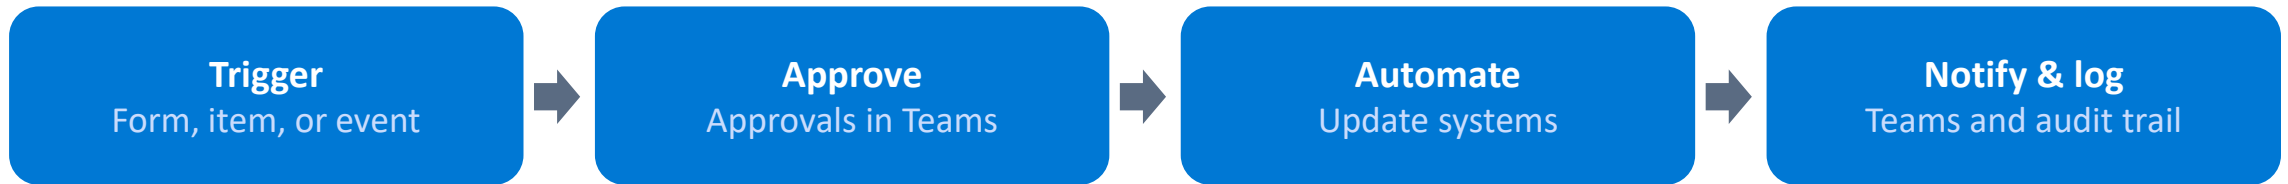

Azure Boards gives 6,000 Jira users backlogs, sprints, and boards without leaving Microsoft

- **Work items & backlogs**
Epics, features, stories, tasks, and bugs in one hierarchy
- **Boards & sprints**
Kanban boards, sprint planning, capacity, and taskboards
- **Queries & dashboards**
WIQL queries, charts, Analytics views, and Delivery Plans
- **Code linkage**
Link work to Azure Repos and GitHub commits and pull requests
- **End-to-end traceability**
Requirement to code to test to release, fully linked
- **Extensible platform**
REST APIs and Marketplace extensions for custom needs

SharePoint with Loop and OneNote replaces Confluence spaces with governed, searchable content

- **Sites & pages**
Modern pages and communication sites replace Confluence spaces
- **Co-authoring**
Real-time co-authoring in Word, Excel, PowerPoint, and Loop
- **Templates & web parts**
Reusable page templates and web parts keep content consistent
- **Microsoft Search**
Unified, secure search across SharePoint and Microsoft 365
- **Governance built in**
Purview retention, DLP, and eDiscovery applied automatically
- **Knowledge & intranet**
Viva Topics and portals turn content into discoverable knowledge

Power Automate and Purview extend automation and compliance beyond native Jira and Confluence

Governance built in

 **Microsoft Entra ID**
Conditional access, SSO, MFA, and least-privilege roles

 **Microsoft Purview**
Retention, DLP, sensitivity labels, and eDiscovery

 **Audit & compliance**
Unified audit logs and compliance reporting

One identity and one collaboration fabric connect DevOps, SharePoint, Teams, and Copilot

Microsoft Entra ID — one identity and access across every workload

Microsoft Teams

Work, files, and approvals hub

Microsoft 365

Docs, Loop, and OneNote

Power BI

Live data dashboards

Power Automate

Cross-app workflows

Microsoft Copilot

AI across your work

Azure DevOps and SharePoint plug into the same fabric, with no separate SSO and no data silos.

Target state consolidates work, code, and content under one governed platform

Source: LNW Jira instance statistics, July 2026. Migration runs in phased waves, preserving history, attachments, comments, and custom configuration.

Jira migrates to Azure DevOps in four phases, preserving history and workflows

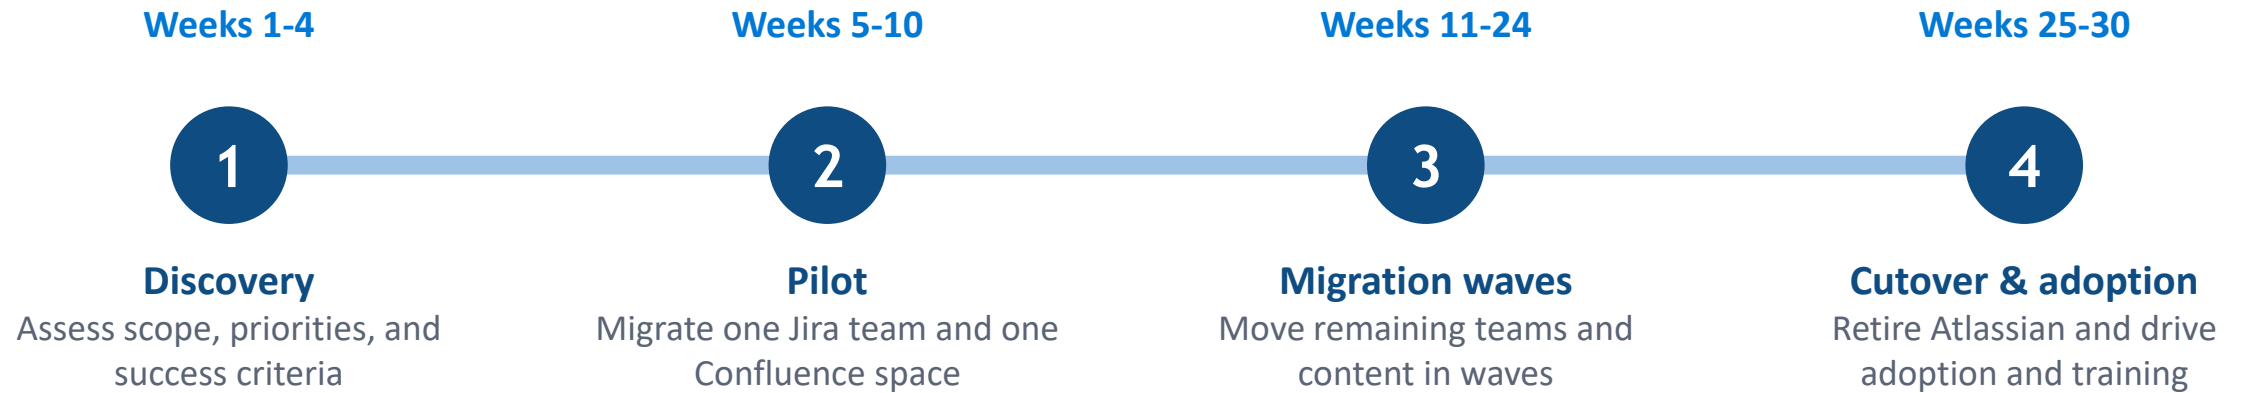

Tooling: Azure DevOps Migration Tools (open source) and the Azure DevOps REST APIs

Confluence spaces migrate to SharePoint sites with content mapped and governance applied

Tooling: SharePoint Migration Tool, Migration Manager, and partner migration tools

A phased rollout sequences discovery, pilots, and cutover across both platforms

Illustrative timeline, refined with LNW based on scope and resourcing

Every capability is backed by Microsoft Learn guidance, GitHub tooling, and reference articles

Consolidating on Microsoft reduces tool sprawl and leverages existing Azure and Microsoft 365 agreements

- ✓ SharePoint is included in the Microsoft 365 E3 and E5 plans many teams already own
- ✓ Azure DevOps uses simple per-user licensing, with the first five users free per organization
- ✓ Reuse existing Microsoft Entra ID for identity, with no separate Atlassian Access
- ✓ Fewer third-party marketplace apps and integrations to license and maintain
- ✓ Consolidated security, compliance, and support under one vendor

Why it adds up

- One vendor and one bill
- One identity for everyone
- Builds on the M365 and Azure you own
- Less integration to maintain

A detailed cost model will be built with LNW using actual user counts and current agreements.

A realistic estimate shows about \$0.4M in annual savings, roughly 40 percent

CURRENT STATE (realistic annual)

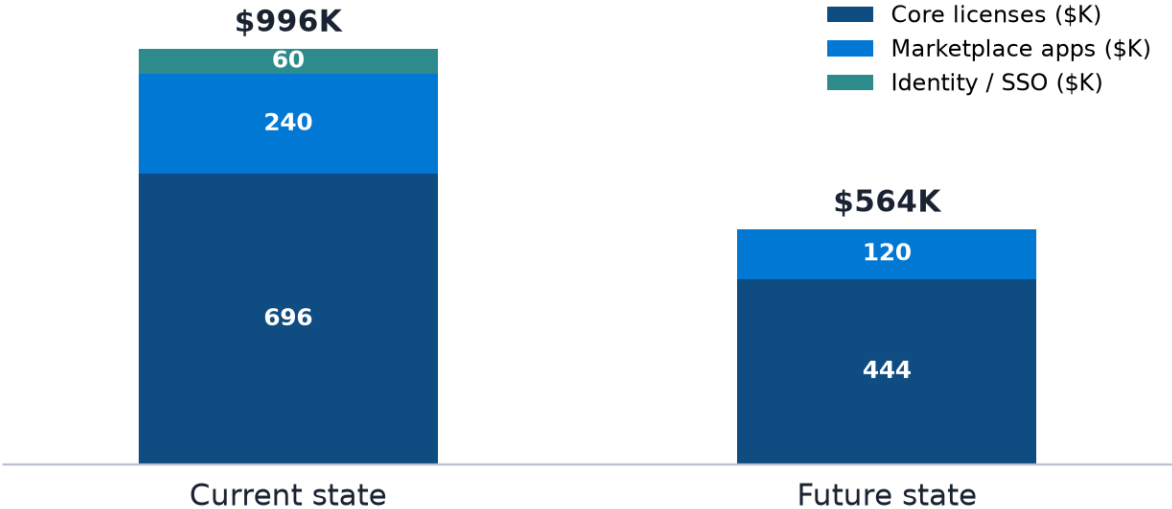

\$1.0M
per year

Jira licenses (5,000) \$480K
 Confluence (3,000) \$216K
 Marketplace apps \$240K
 Identity add-on (Okta) \$60K

FUTURE STATE (realistic annual, incremental)

\$0.56M
per year

Azure DevOps Basic (4,000) \$288K
 Azure Test Plans (QA) \$156K
 Reporting & residual apps \$120K
SharePoint & Entra ID \$0, in M365

≈ \$0.43M saved per year, about 43%
 SharePoint, identity, and search are included in existing Microsoft 365

Realistic estimate assuming enterprise volume discounts on Atlassian and most users needing paid Azure DevOps; the list-price ceiling is higher. Actual Atlassian cost is negotiated and Microsoft cost depends on existing agreements, to be validated in a detailed TCO with LNW. Microsoft 365 Copilot is an optional add-on (about \$360K per year for 1,000 seats).

Key migration risks are known and mitigated through pilots, mapping, and parallel run

Risk	Mitigation
Workflow parity gaps	Map workflows early and validate them in the pilot before bulk migration
Macro and plugin equivalents	Inventory Confluence macros; replace with web parts or Power Platform
User adoption	Champions, training, and a Teams-based rollout supported by Viva
Data fidelity and history	Migrate history and links in waves and reconcile after each wave
Integration rework	Rebuild CI/CD and app links on Azure Pipelines and Microsoft Graph

Let's schedule the working session with Ashish to validate fit and shape the plan

- 1 Confirm the priority Jira and Confluence capabilities and workflows
- 2 Review the feature matrix and target architecture together
- 3 Scope a pilot team for Azure DevOps and SharePoint
- 4 Agree a phased timeline and success criteria
